

Thank you for your purchase.

The Firing Line MKII fuzz is a pedal that calls upon the well known and revered Tone Bender MKII circuit of decades past. The circuit was updated for more flexibility and to cut some of the overwhelming "woofiness" out of it to make it stand out in the mix better while improving note clarity.

It's wired up as a negative ground circuit so you can use it with all of the same power supplies that power the rest of your pedalboard such as 1-Spot, GodLyke etc.

Powered by a trio of audited and selected high quality new old stock germanium transistors. It delivers that fat fuzz tone with the long sustain.

The Firing Line MKII works best when placed first in your signal chain directly after your guitar.

Controls:

Attack:

Controls the amount of Fuzz.

Level:

Controls the overall volume.

Saturation:

An externally adjustable transistor bias control.

Go from thick and woolly to thinner and louder to a bit sputtery and gated with just the twist of the Saturation control.

Set it where you like it best.

Power Requirements:

The Firing Line MKII requires 9V DC negative ground power source. Use of a regulated 9V power supply is recommended.

Fully daisy-chainable with modern negative ground pedals and power supplies.

Current Consumption 4mA

The Firing Line MKII features:

3 vintage N.O.S. (new old stock) germanium transistors. Fully tested and selected for the proper desired qualities and tone.

True-Bypass Switching

Negative ground DC power jack. It works with all your other negative ground pedals and power supplies.

Fits standard 2.1mm plug.

Hand built quality.

Awesome vintage tone.

Warranty:

Comes with a 1-year limited* warranty against parts and workmanship.

*see website for details.

No user serviceable parts inside.
